

Your Build Guide

A friendly plan for building the AI website + the Free AI Audit quiz

Hey — this one's for you

You're going to build a small website and a fun quiz for a real company. That's a genuinely cool project, and this guide walks you through exactly what to make, in plain language.

You don't need to know everything already. Read it once end-to-end, then keep it open while you build. Whenever you see a word you don't know, there's usually a quick explanation right next to it.

Take it one section at a time. You've got this.

Made for: the builder (that's you!)

Project owner: Rajesh (ask him whenever you're unsure — that's normal and encouraged)

What you're building: a mini-website + an interactive “AI Audit” quiz for Avinya Spark

1. The Big Picture — what are we making?

Avinya Spark is a company that helps other businesses use **AI** (smart computer tools) to work better and grow. Your job is to build two things that work together:

- 1) **A small website** — a few clean, good-looking pages that explain what the company does.
- 2) **A “Free AI Audit” quiz** — a short quiz a visitor can take. They answer some questions, get a **score** for how much their business already uses technology and AI, and then see a friendly report showing how AI could help them.

The quiz is the star of the show. It's fun to take, and it helps the company find people who might want their help. Think of it a bit like those “Which character are you?” quizzes online — except this one gives a useful business score.

The one big idea to remember

Avinya doesn't just ask people “what tech do you want?” — it asks “what are you trying to achieve?” and then shows how AI can get them there.

So everything you build should talk about results and helping the visitor — not about fancy technology for its own sake.

2. Who will use this site?

Mostly business owners and company bosses — busy grown-ups who don't have much time. That means the site should be:

- Simple and clear — no confusing words, no clutter.
- Fast — pages should load quickly, even on a phone.
- Trustworthy — it should look professional and polished, so people take it seriously.

Most of them will open it on a **phone**, so always check that everything looks great on a small screen, not just a laptop.

3. The website — the pages to build

Build these five pages. They all share the same top menu and the same footer (the strip at the very bottom). On every page, there should be one clear button that says something like “**Take the Free AI Audit**”.

Page	What it's for	What goes on it
1. Home	First page people see	A big friendly headline, a short intro, the 3 services, and the main quiz button
2. Services	Explains what they offer	The 3 AI services explained simply, plus common questions (an FAQ)

Page	What it's for	What goes on it
3. Free AI Audit	The quiz lives here	The quiz itself, plus the results and report (see Section 4)
4. About	Who's behind it	A short story about Rajesh and the team, with photos
5. Contact	How to reach them	A simple form + a way to book a call

A little more on each page

Home page. At the very top, before anyone scrolls, show a short punchy sentence about what the company does and the big quiz button right next to it. Below that, show the three services as three cards, a bit about Rajesh, and a couple of nice quotes from happy clients (Rajesh will give you these).

Services page. Explain the three main services in simple, friendly language (list is in Section 7). Also show the three “packages” as three options side by side.

Important: no prices yet

Do NOT put any prices, costs, or money amounts anywhere on the site.

Where a price would normally go, just use a button that says “Book a call” instead. Rajesh will decide prices later.

About page. Tell Rajesh's story as a **business leader who has worked around the world and is now big on AI**. Keep it inspiring but professional. Add his photo and a short bit about the team.

Contact page. A short form (name, email, company, a message) and a calendar so people can book a call. Keep the form short — the fewer boxes to fill in, the more people will actually use it.

4. The Free AI Audit quiz — the fun part!

This is the most important thing you'll build, so take your time. Here's how it should work, step by step, from the visitor's point of view:

1. They see a welcome screen: “Take this quick quiz to find out how AI-ready your business is. Takes about 3–5 minutes. It's free!” and a Start button.
2. They answer the questions one at a time, with a little progress bar showing how far along they are. Most questions should be multiple-choice (pick A, B, C or D) so it's quick and easy.
3. Near the end, ask 1–2 quick questions about them (their industry and how big their company is) so the result can feel personal.
4. Before showing the full result, ask for their name and email — this is how the company gets to follow up. Show a sneak peek of their score so they're excited to enter it.
5. Show the results screen: a big score, a friendly label, a breakdown, and 3 suggestions for what to improve.
6. Send them a nice-looking report (a PDF) to their email, with the company's logo on it.

How the scoring works

The quiz measures a few different areas (we call them “**pillars**”) — things like how the business uses data, how it finds customers, and how ready its team is for AI. Rajesh will give you the exact questions and the point values.

- Each answer is worth some points.
- Add up the points to get a total score — for example, out of 100.
- Depending on the score, show a friendly label, like: “**AI-Curious**” (just getting started), “**AI-Ready**” (doing well), or “**AI-Accelerating**” (super advanced).

Build it so it's easy to change later

Rajesh's team should be able to tweak the questions, the points, and the labels without needing you every time.

So don't “hard-bake” the numbers deep in the code if you can avoid it — keep them somewhere easy to edit (like a settings area or a simple spreadsheet the quiz reads from).

What the results screen should show

- The total score and the friendly label, with a short encouraging message.
- A breakdown showing how they did in each area — bars or a simple chart look great here.
- The top 3 things they could improve, each with a one-line note on how AI could help.
- A clear button: “**Book a free AI strategy call**” — this is the whole point, so make it stand out.

5. Where do the answers go?

When someone finishes the quiz or fills in the contact form, their details need to reach the company. Set up these three things:

What	In plain words
An email alert	The company gets an email straight away with the person's name, email and score. (Start with this one — it's the simplest.)
A contacts list (“CRM”)	A CRM is just an address book for a business. New people from the quiz should automatically get added to it. Ask Rajesh which one they use (common ones: HubSpot or Zoho).
A booking calendar	A tool like Calendly where people can pick a time to talk. The “Book a call” buttons should open this.

Do them in order

Get the email alert working first — that's the must-have. The CRM and calendar are the next step up. If any part feels tricky, that's totally fine — just ask Rajesh and do the email one first.

6. Look and feel

Rajesh will give you the **logo, colours, fonts and photos** to use. Please stick to those so everything matches. The style you're going for is:

- Clean and modern — lots of space, not crammed.
- Professional and premium — it should feel high-quality and trustworthy.
- A bit bold and exciting — this is a company about the future and AI, so it can feel energetic.

Good habit: **design first, build second**. Before you code a page, sketch it or lay it out (paper, Figma, or Canva all work). Show Rajesh, get a thumbs-up, then build. That saves a ton of re-doing.

Make it work for everyone

Use text that's easy to read (good contrast — dark text on light backgrounds).

Make buttons big enough to tap with a thumb.

Add short descriptions to images so screen readers can describe them. This is called accessibility, and it's a mark of a pro.

7. Handy facts about the company

Keep these nearby so the words on the site are correct. Rajesh will confirm the final wording.

The company

Avinya Spark International — website avinyaspark.com. It helps businesses grow, and its newest and biggest offering is AI help.

The three main AI services

- **AI Business Growth Audit** — finds where AI can help a business the most.
- **AI Lead Generation Engine** — smart tools that help a business find new customers automatically.
- **AI CEO Assistant** — an AI helper for a boss that handles scheduling, summaries and reminders.

The three packages (names only — no prices)

- **Spark AI Ignite** — for getting started.
- **Spark AI Momentum** — for growing faster.
- **Spark AI Horizon** — for a full transformation.

The people

- **Rajesh Damerla** — the founder. A business leader who has worked in many countries and is now focused on AI.
- **Neha** — builds the AI tools behind the scenes.

8. Tools you could use to build it

There's no single “right” way — use what you're comfortable with. Here are friendly options. Chat with Rajesh about which to pick.

For...	Easier / no-code options	More advanced (coding) options
The website	Wix, Framer, Carrd, WordPress	HTML/CSS, or React / Next.js
The quiz	Typeform, ScoreApp, Outgrow, involve.me	Build your own with JavaScript
The booking calendar	Calendly, Cal.com	Same — these embed easily
Designing / sketching	Figma, Canva, or paper	Figma

Pro tip

If this is your first big project, starting with no-code or low-code tools (like Framer for the site and Typeform or ScoreApp for the quiz) will get you a great result faster. You can always go more advanced later.

One thing to check: make sure whatever tool you pick lets the company download the quiz answers (so the info isn't locked inside an app they can't get out of).

9. A good order to build things

You don't have to do it all at once. Here's a friendly order that keeps things manageable:

1. Chat with Rajesh: get the logo, colours, photos, quiz questions and the point values.
2. Sketch the pages and the quiz (design first!). Show Rajesh and get a thumbs-up.
3. Build the website pages with the real words and pictures.
4. Build the quiz: questions → score → results screen → emailed report.
5. Connect the email alert, then the contacts list, then the booking calendar.
6. Test everything on a phone and a computer. Fix anything that looks off.
7. Show Rajesh, make final tweaks, and go live!

10. “It's done!” checklist

You can call it finished when you can tick all of these:

- All 5 pages are built and look great on a phone AND a computer.
- Every page has a clear “Take the Free AI Audit” button.
- The quiz works start to finish: questions → correct score → results → a report emailed to the person.

- Finishing the quiz sends an email alert to the company (and adds the person to the contacts list, if you set that up).
- The “Book a call” buttons open the booking calendar.
- There are NO prices or money amounts anywhere on the site.
- Nothing is broken — no dead buttons, no missing images, no typos.
- You showed Rajesh and he's happy.

11. Good questions to ask Rajesh

Asking questions is smart, not a weakness. Here are some worth asking before and during the build:

1. Can you send me the logo, colours, fonts and photos?
2. What are the exact quiz questions, the points for each answer, and the score labels?
3. Which contacts list (CRM) and which booking calendar do you use?
4. Do you want the site as part of avinyaspark.com, or somewhere separate? (There's a bigger plan document that recommends part of the main site.)
5. Can you write me a couple of happy-client quotes to show on the site?
6. Who should get the email alert when someone finishes the quiz?

Have fun building — and be proud of it. This is a real project for a real company.
